REPRESENTATIONS OF PREFERENCE ORDERINGS BY COHERENT UPPER AND LOWER PREVISIONS DEFINED WITH RESPECT TO HAUSDORFF OUTER AND INNER MEASURES

-Complex decisions and their integral representation
-Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

In a metric space

- A new model of coherent upper conditional prevision based on Hausdorff outer measures is introduced.

If the conditioning event has positive and finite Hausdorff outer measure in its Hausdorff dimension

- The given coherent upper conditional prevision is proven to be **monotone, comonotonically additive, submodular** and **continuous from below**.

If the conditioning event has positive and finite Hausdorff outer measure in its Hausdorff dimension

- A coherent upper conditional prevision is characterized as the Choquet integral with respect to the upper conditional probability defined by its associated Hausdorff outer measure.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A complex decision is a decision where the best alternative cannot be obtained by a preference ordering represented by a linear functional

A functional Γ defined on the class $L(B)$ of all random variables defined on a non-empty set B is linear if for every $X, Y \in L(B)$ and for every $\alpha, \beta \in \mathcal{R}$

$$\Gamma(\alpha X + \beta Y) = \alpha \Gamma(X) + \beta \Gamma(Y)$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A preference ordering on the class $L(B)$ of all random variables defined on B is represented by a linear functional Γ (e.g. the weighted sum) if and only if

$$X \succ Y \Leftrightarrow \Gamma(X) > \Gamma(Y)$$

and

$$X \simeq Y \Leftrightarrow \Gamma(X) = \Gamma(Y)$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Nevertheless not all preference orderings can be represented by a linear functional

Example 1 Let Ω be a non-empty set, $\mathbf{B} = \{B_1, B_2\}$ and let μ be a probability measure defined on the field generated by \mathbf{B} . Let consider the class $K = \{X_1, X_2, X_3\}$ of bounded \mathbf{B} -measurable random variables defined on \mathbf{B} by

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Random variables	B_1	B_2
X_1	0.3	0.3
X_2	0.7	0
X_3	0	0.7

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

The preference ordering $X_1 \succ X_2$ and $X_2 \approx X_3$ cannot be represented by the linear functional (the weighted sum)

$$\Gamma(X) = \sum_{i=1}^2 \mu(B_i)x_i$$

since there exists no probability measure μ such that the following system has solution:

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

$$\begin{cases} X_1 \succ X_2 \\ X_1 \approx X_2 \end{cases} \Leftrightarrow \begin{cases} 0.3\mu(B_1) + 0.3\mu(B_2) > 0.7\mu(B_1) + 0\mu(B_2) \\ 0.7\mu(B_1) + 0\mu(B_2) = 0\mu(B_1) + 0.7\mu(B_2) \\ \mu(B_1) + \mu(B_2) = 1 \end{cases}$$

Remark If only the random variables X_1 and X_2 are considered we have that the

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

preference $X_1 \succ X_2$ can be represented by a linear functional, since

$$X_1 \succ X_2 \Leftrightarrow \begin{cases} 0.3\mu(B_1) + 0.3\mu(B_2) > 0.7\mu(B_1) + 0\mu(B_2) \\ \mu(B_1) + \mu(B_2) = 1 \end{cases}$$

and the system has solutions: all pair $(\mu(B_1); \mu(B_2))$ with $\mu(B_1) < \frac{3}{7}$ and $\mu(B_2) = 1 - \mu(B_1)$.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

The previous example put in evidence the necessity to introduce non-linear functionals to represent preference orderings and to investigate **equivalent** random variables.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

For B in \mathcal{B} let $X|B$ be the restriction to B of a random variable X defined on Ω and let $\sup X|B$ be the supreme value assumed by X on B .

For B in \mathcal{B} and $X|B$ in $\mathbf{K}(B)$ a **coherent upper conditional prevision** $\bar{P}(X|B)$ is a real functional on $\mathbf{K}(B)$ such that the following conditions hold for every $X|B$ and $Y|B$ in $\mathbf{K}(B)$ and positive constant λ :

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

-Complex decisions and their
integral representation
-Coherent upper conditional
previsions defined by Hausdorff
outer measures
- Preference Orderings

1. $\bar{P}(X|B) \leq \sup X|B$

2. $\bar{P}(\lambda X|B) = \lambda \bar{P}(X|B)$ positive homogeneity

3. $\bar{P}(X + Y|B) \leq \bar{P}(X|B) + \bar{P}(Y|B)$ subadditivity

4. $\bar{P}(I_B|B) = 1$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

If $\bar{P}(X|B)$ is a coherent upper conditional prevision on a linear space $\mathbf{K}(B)$ then its conjugate **coherent lower conditional prevision** is defined by $\underline{P}(X|B) = -\bar{P}(-X|B)$ and

$$\underline{P}(X|B) \leq \bar{P}(X|B)$$

If for every $X|B$ belonging to $\mathbf{K}(B)$ we have

$$P(X|B) = \underline{P}(X|B) = \bar{P}(X|B)$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

then $P(X|B)$ is called a **coherent linear conditional prevision** and it is a linear, positive functional on $\mathbf{K}(B)$.

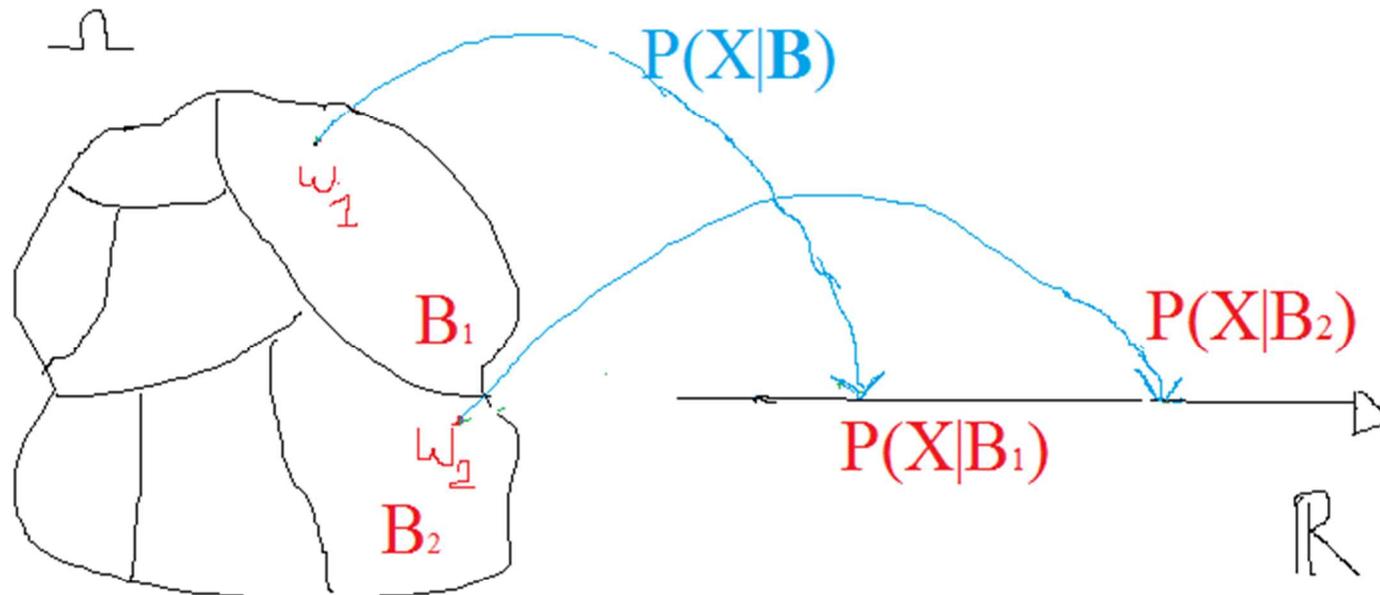

For each X in $\mathbf{K}(\mathbf{B})$ let $\bar{P}(X|\mathbf{B})$ be the function defined on Ω by

$$\bar{P}(X|\mathbf{B})(\omega) = \bar{P}(X|B) \quad \text{if } \omega \in B.$$

$\bar{P}(X|\mathbf{B})$ is called a *coherent upper conditional prevision* and it is coherent if all the $\bar{P}(X|B)$ are coherent.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A necessary and sufficient condition for an upper prevision \bar{P} to be coherent is to be the *upper envelope* of linear previsions, i.e. there exists a class M of linear previsions, defined on a same domain, such that

$$\bar{P}(X) = \sup\{P(X): P \in M\}$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A new model of coherent upper conditional previsions

Coherent upper conditional prevision defined by its associated Hausdorff outer measure

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A random variable X on Ω is **B-measurable** or **measurable with respect to the partition \mathbf{B}** if it is constant on the atoms of the partition **B** (Walley 1991, p.291).

Necessary condition for coherence

If for every $B \in \mathbf{B}$ $P(X|B)$ are coherent linear conditional previsions and X is **B-measurable** then (Walley 1991, p. 292)

$$P(X|\mathbf{B}) = X$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Motivations

Why the necessity to propose a new model of coherent upper conditional prevision $\bar{P}(X|B)$?

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Because coherent upper conditional prevision $\bar{P}(X|B)$ cannot always be defined as extension of conditional expectation $E(X|G)$ of measurable random variables.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

In fact conditional expectation $E(X|G)$ defined by the Radon-Nikodym derivative, according to the axiomatic definition, may fail to be separately coherent.

It occurs because one of the defining properties of the Radon- Nikodym derivative, that is to be measurable with respect to the sigma-field of the conditioning events, contradicts a necessary condition for the coherence ($P(X|B) = X$).

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Linear separately coherent conditional prevision $P(X|\mathbf{B})$ can be compared with conditional expectation $E(X|\mathbf{G})$ if the partition \mathbf{B} generates the sigma-field \mathbf{G} (Koch, 1997, p.262)

$$E(X|\mathbf{G})(\omega) = P(X|B) \quad \text{if } \omega \in B \quad \text{with } B \in \mathbf{B}.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition of conditional expectation (Billingsley, 1986)

Let \mathbf{F} and \mathbf{G} be two sigma-fields of subsets of Ω with $\mathbf{G} \subset \mathbf{F}$ and let X be an integrable, \mathbf{F} -measurable random variable. Let P be a probability measure on \mathbf{F} ; define a measure ν on \mathbf{G} by

$$\nu(G) = \int_G X dP.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

This measure is finite and absolutely continuous with respect to P (i.e. $P(A) = 0 \implies \nu(A) = 0 \quad \forall A \in \mathbf{G}$).

Thus there exists a function, **the Radon-Nikodym derivative**, denoted by $E(X|\mathbf{G})$, \mathbf{G} -measurable, integrable and satisfying the functional equation

$$\int_G E(X|\mathbf{G})dP = \int_G XdP \quad \text{with } G \text{ in } \mathbf{G}.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

This function is unique up to a set of P -measure zero and it is a version of the conditional expectation value.

If linear conditional prevision $P(X|B)$ is defined by the Radon-Nikodym derivative the necessary condition for coherence $P(X|B) = X$ is not always satisfied.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Theorem 1 Let $\Omega = [0,1]$, let \mathbf{F} be the Lebesgue sigma-field of $[0,1]$ and let P be the Lebesgue measure on \mathbf{F} . Let \mathbf{G} be a sub sigma-field properly contained in \mathbf{F} and containing all singletons of $[0,1]$. Let \mathbf{B} be the partition of all singletons of $[0,1]$ and let X be the indicator function of an event A belonging to $\mathbf{F}-\mathbf{G}$. If we define the linear conditional prevision

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

$P(X|\{\omega\})$ equal to the Radon-Nikodym derivative with probability 1, that is

$$P(X|\{\omega\}) = E(X|\mathbf{G})$$

except on a set N of $[0,1]$ of P -measure zero, then the conditional prevision $P(X|\{\omega\})$ is not coherent.

(Theorem 1 S. Doria, Annals of Operation Research, Vol. 195, pp.38-44, 2012)

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

If the equality $P(X|\{\omega\}) = E(X|\mathbf{G})$ holds with probability 1, the linear conditional prevision $P(X|\{\omega\})$ is different from X , the indicator function of A . In fact having fixed A in $\mathbf{F}-\mathbf{G}$ the indicator function of A is not \mathbf{G} -measurable.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

It occurs because for every Borel set C

$$X^{-1}(C) = \{\omega \in \Omega : X(\omega) \in C\} =$$

$$= \begin{cases} \emptyset & \text{if } 0, 1 \notin C \\ A & \text{if } 1 \in C \text{ and } 0 \notin C \\ A^c & \text{if } 0 \in C \text{ and } 1 \notin C \\ \Omega & \text{if } 0, 1 \in C \end{cases}$$

WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

-Complex decisions and their
integral representation
-Coherent upper conditional
previsions defined by Hausdorff
outer measures
- Preference Orderings

and since $A \notin \mathbf{G}$ then X is not \mathbf{G} -measurable.

Example 1(Billingsley, 1986; Seidenfeld et al. 2001)

Let $\Omega = [0,1]$

\mathbf{F} =Borel sigma-field of Ω ,

P = the Lebesgue measure on \mathbf{F}

\mathbf{G} = the sub sigma-field of sets that are either countable or
co-countable

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

\mathcal{B} = the partition of all singletons of $[0,1]$.

If the linear conditional prevision is equal, with probability 1, to conditional expectation defined by the Radon-Nikodym derivative, we have that

$$P(X|\mathcal{B}) = E(X|\mathcal{G}) = P(X)$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

since the events in \mathcal{G} have probability either 0 or 1.

So when X is the indicator function of an event $A=[a,b]$ with $0 < a < b < 1$ then

$$P(X|\mathcal{B}) = P(A)$$

and it does not satisfy the necessary condition for coherence, that is

$$P(X|\{\omega\}) = X.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Evident from Theorem 1 and Example 1 is the necessity to introduce a new mathematical tool to define coherent conditional previsions.

The model

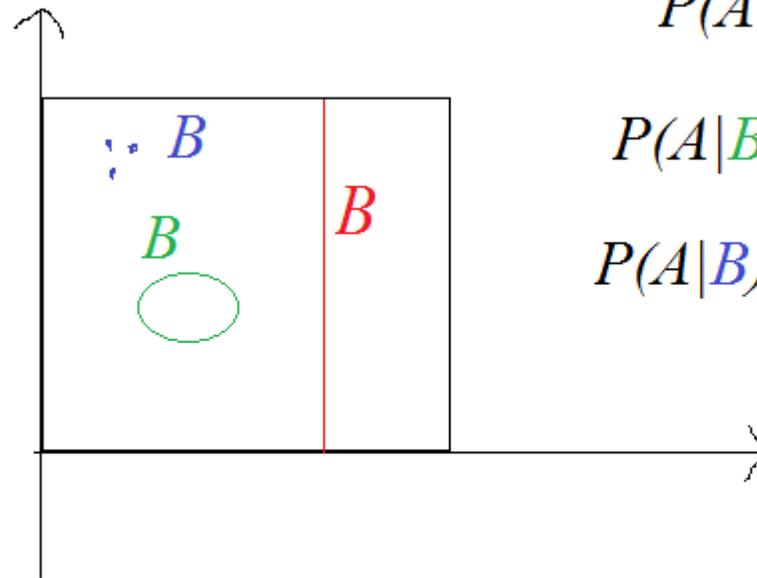

Let (Ω, d) be a metric space.

For every $B \in \mathcal{B}$ denote by s the Hausdorff dimension of the conditioning event B and by h^s the Hausdorff s -dimensional outer measure.

h^s is called the **Hausdorff outer measure associated** with the coherent upper conditional prevision $\bar{P}(X|B)$.

MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

The preference ordering cannot be represented by the coherent upper prevision \bar{P} since

$$\bar{P}(X_1) = 0.3 \quad \text{and} \quad \bar{P}(X_2) = \bar{P}(X_3) = 0.7$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

The preference ordering $X_1 \succ X_2$ and $X_2 \simeq X_3$ can be also represented by the **vacuous lower probability** defined by

$$\underline{P}(X|\Omega) = \inf\{X(\omega): \omega \in \Omega\}$$

In fact

$$\underline{P}(X_1|\Omega) = 0.3 \quad \text{and} \quad \underline{P}(X_2|\Omega) = \underline{P}(X_3|\Omega) = 0$$

and also in this case $\underline{P}(I_{B_1}) = \underline{P}(I_{B_2}) = 0$.

MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

In multi-criteria decision problem denoted by Ω the set of criteria, the elements of a partition \mathbf{B} can represent clusters or macro-criteria- which are representative of the general objectives of the decision problem, as goals to pursue through the implementation of specific policies - and the elements in each $B \in \mathbf{B}$ are the criteria.

To determine the best alternative with respect to all criteria we should require that the non-linear functional which

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

represent the preference ordering, satisfies the **disintegration property** so that we can compare all the alternatives on each cluster and then to aggregate the obtained results.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

Orderings represented by coherent lower and upper conditional previsions

A *strict ordering* (i.e. *antisymmetric* and *transitive* binary relation) induced by a coherent lower conditional prevision $\underline{P}(\cdot | B)$ can be defined on the class of random variables belonging to $L(B)$ (Walley (Section 3.8.1)):

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition 1 We say that the random variable X_i is *preferable* to X_j given B with respect to $\underline{P}(\cdot | B)$, i.e. $X_i \succ_* X_j$ given B if and only if

$$\underline{P}(X_i - X_j | B) > 0.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Some information can be lost when a strict preference order is defined by $\underline{P}(\cdot | B)$ since \underline{P} does not contain any information about which random variable, with $\underline{P}(X|B) = 0$ are really desirable.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

In Walley (section 3.9.4) the following definitions are given.

Definition 2 Let K be a finite class of random variables. A random variable X_i in K is *inadmissible* in K given B if there is X_j in K such that $X_j \succ_* X_i$ with $j \neq i$. Otherwise X_i is *admissible* in K .

X_i is admissible in $K \Leftrightarrow \underline{P}(X_j - X_i) < 0 \forall X_j \in K$ with $i \neq j$.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A *weak ordering* (i.e. *reflexive* and *transitive* binary relation) induced by a coherent upper conditional prevision $\bar{P}(\cdot | B)$ can be defined on the class of random variables belonging to $L(B)$ (Doria, 2014):

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition 2 We say that the random variable X_i is *preferable* to X_j given B with respect to $\bar{P}(\cdot | B)$, i.e. $X_i \succ_* X_j$ given B if and only if

$$\bar{P}(X_i - X_j | B) > 0.$$

COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition 3 We say that the random variable X_i and X_j are *equivalent* given B with respect to $\bar{P}(\cdot | B)$, i.e. $X_i \approx^* X_j$ given B if and only if

$$\bar{P}(X_i | B) = \bar{P}(X_j | B).$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

-Complex decisions and their
integral representation
-Coherent upper conditional
previsions defined by Hausdorff
outer measures
- Preference Orderings

Definition 4 We say that the random variable X_i and X_j are *indifferent* given B with respect to $\bar{P}(\cdot | B)$, i.e. $X_i \approx X_j$ given B if and only if

$$\bar{P}\left((X_i - X_j)|B\right) = \bar{P}\left((X_j - X_i)|B\right) = 0.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition 5 An admissible random variable X_i in K is *maximal* in K given B under the coherent lower prevision $\underline{P}(\cdot | B)$ when X_i is admissible in K and

$$\overline{P}(X_i - X_j | B) \geq 0 \quad \forall X_j \text{ in } K.$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

If $P(\cdot | B)$ is a **linear prevision**, the maximal random variable belonging to $L(B)$ with respect to $P(\cdot | B)$ is the admissible random variable X_i which satisfies

$$P(X_i | B) \geq P(X_j | B) \text{ for all } X_j \text{ in } K.$$

Any alternative which maximizes $P(X_j | B)$ over X_j in K is called a *Bayes random variable* under $P(\cdot | B)$.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

A **Bayes random** variable under a coherent lower conditional prevision is a random variable which is maximal under a linear prevision on the class of all random variables defined on B .

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Definition 3 An admissible random variable X_i is defined to be a *Bayes random variable* under a coherent lower prevision \underline{P} when, for each X_j in K there is a linear prevision $P \in M(\underline{P})$ such that $P(X_i|B) \geq P(X_j|B) \forall X_j$ in K .

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

If X_i is maximal under some $P \in M(\underline{P})$ then

$$P(X_i|B) \geq P(X_j|B) \quad \forall X_j \text{ in } K \text{ so}$$

$$\overline{P}(X_i - X_j|B) \geq P(X_i - X_j|B) = P(X_i) - P(X_j) \geq 0$$

and X_i is maximal under \underline{P} .

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

So a Bayes random variable under a coherent lower prevision \underline{P} is maximal under \underline{P} but the converse is not true.

X is a Bayes random variable under $\underline{P} \Rightarrow X$ is maximal under \underline{P}

\Leftarrow

REPRESENTATIONS OF PREFERENCE ORDERINGS BY

- Preference Orderings

Example 1 (continued)

Random variables	B_1	B_2
X_1	0.3	0.3
X_2	0.7	0
X_3	0	0.7

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

We consider the following class of probability measures

	B_1	B_2
P_1	1	0
P_2	0	1
$\bar{\mu}$	1	1
$\underline{\mu}$	0	0

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

-Complex decisions and their
integral representation
-Coherent upper conditional
previsions defined by Hausdorff
outer measures
- Preference Orderings

We obtain

$$\underline{P}(X_i - X_j) = C \int (X_i - X_j) d\underline{\mu} < 0 \quad \text{for all } i, j \in \{1, 2, 3\} \text{ with } i \neq j$$

so **all random variables X_i for all $i \in \{1, 2, 3\}$ are admissible**

and

$$\overline{P}(X_i - X_j) = C \int (X_i - X_j) d\overline{\mu} \geq 0 \quad \text{for all } i, j \in \{1, 2, 3\}$$

so **all random variables X_i for all $i \in \{1, 2, 3\}$ are maximal.**

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

No random variable X_i for all $i \in \{1,2,3\}$ is a Bayes random variable.

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

According to the model based on Hausdorff outer measures, by Theorem 1 , if all the conditioning events has Hausdorff measure in its Hausdorff dimension equal to 0 or $+\infty$, a coherent conditional prevision can be defined on a 0-1 valued measure m finitely additively but not countably additive on $P(\Omega)$.

MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

Example

Let (Ω, d) be a metric space with $\Omega = N$ so that $\dim_H \Omega = 0$ and $h^0(\Omega) = +\infty$. Let $\mathbf{B} = \{B_1, B_2\}$ be the partition of Ω where $B_1 = \{p \in N : p = 2n; n \in N\}$ and $B_2 = \{d \in N : d = 2n - 1; n \in N\}$ so that $\dim_H B_1 = \dim_H B_2 = 0$ and $h^0(B_1) = h^0(B_2) = +\infty$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

We consider the following probability measures

	$h^s(B_1) = +\infty$	$h^s(B_2) = +\infty$
$P(X B_1) = m_{B_1}$		
$P(X B_2) = m_{B_2}$		

We can choose m_{B_1} such that

$$P(X_1|B_1) = 1; P(X_2|B_1) = 0; P(X_3|B_1) = 0$$

REPRESENTATIONS OF PREFERENCE ORDERINGS BY
COHERENT UPPER AND LOWER PREVISIONS DEFINED
WITH RESPECT TO HAUSDORFF OUTER AND INNER
MEASURES

- Complex decisions and their integral representation
- Coherent upper conditional previsions defined by Hausdorff outer measures
- Preference Orderings

We can choose m_{B_2} such that

$$P(X_1|B_2) = 1; P(X_2|B_2) = 0; P(X_3|B_2) = 0$$

we can choose m_Ω such that

$$P(X_1|\Omega) = 1; P(X_2|\Omega) = 0; P(X_3|\Omega) = 0$$

and $P(B_1|\Omega)=0$ and $P(B_2|\Omega) = 1$ so that

the disintegration property holds since

The ordering

$$X_1 \succ X_2 \text{ and } X_2 \simeq X_3$$

can be represented by the coherent conditional prevision
(defined in Theorem 1)

and it holds with respect to Ω and with respect to B_1 and to B_2 .

X_1 is a maximal and a Bayes random variable with respect to m_Ω .

Maximal random variables and Bayes random variables

Theorem 1

Let $K \subset L(B)$ be a class of *comonotonic random variables* and let μ be a *submodular* coherent upper conditional probability defined on $\wp(B)$ and let $\bar{P}(\cdot | B)$ be a coherent upper conditional prevision defined as Choquet integral with respect to μ then a random variable $X \in K$ is maximal in K if and only if X is a Bayes random variable in K .

Theorem 2

Let $K \subset L(B)$ be a class of random variables and let $X_i \in K$ such that the class $C = \{X_i - X_j; X_j \in K\}$ is comonotonic. Let μ be a *submodular* coherent upper conditional probability defined on $\wp(B)$ and let $\bar{P}(\cdot | B)$ be a coherent upper conditional prevision defined as Choquet integral with respect to μ then a random variable $X \in K$ is maximal in K with respect to the conjugate lower prevision $\underline{P}(\cdot | B)$ if and only if X is a Bayes random variable in K .

Theorem 3

Let $K = \{X_i, X_j\} \subset L(B)$ be a *class containing only two random variables*. Let μ be a *submodular* coherent upper conditional probability defined on $\wp(B)$ and let $\bar{P}(\cdot | B)$ be a coherent upper conditional prevision defined as Choquet integral with respect to μ then a random variable $X \in K$ is maximal in K with respect to the conjugate lower prevision $\underline{P}(\cdot | B)$ if and only if X is a Bayes random variable in K .
